                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises the longer isoform of murine lysosomal trafficking regulator Lystl, a protein that regulates degranulation of lysosomes, late endosomes and acidic secretory granules primarily in leukocytes. Its sequence was deduced from a Lystl cDNA clone (AAT74199) that had been identified from a beige (bq) mutation critical region yeast artificial chromosome. Alternative splicing also yields a shorter isoform (see AAW23595) of Lystl. Homologous human sequences (see AAW23596 and AAW23597) have been continue Lystl and an are associated with Chediax Higashi syndrome (CHS). Murine Lystl and human Lystl polypoptides (see AAW23597) have been expressed in recombinant host cells for use in raising antibodies. Corpused in the development of therapeutic approaches to treatment of autolumnum diseases and certain types of rumours. The existence of an animal model of CHS with a similar quentic lesion will assist efforts to develop novel therapies for this disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             44 CSVVTIVDQTNVKLTCLLFSGNYEALPIIYKNGDIVRFHRLKIQVYKKFTQGITSSGFAS 101

Usurpin polypeptides are useful for in vitro and in vivo identification of usurpin-procaspase-8 interaction inhibitor. Usurpin is useful as moodulator of the sensitivity of cells to CD95(Fas/Apo-1) mediated appotensis. Modulation of apoptosis is useful for treating diseases like autoimmune diabetes, cancer and Parkinson's disease. Activators and inhibitors of usurpin-procaspase-8 interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Fas/Apo-1) receptor can be regulated at several levels in the presence of usurpin, conferring

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimen's and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        method of the invention. The specification describes a method which uses at least one polypoptide or polynucleotide sequence belonding to the perfecan, precursor of the retinol-binding plusma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The
                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple selecosis, using specipolypeptides or related nucleic acid or ligand .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Parkinson's diseases, amyotrophic fateral selerosis, rheumatoid polyarthritis and lupus crythematosus, including use as vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ζ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence and an oligonous operations are completed and an oligonous completed comprises a 3'-end sequence, where the polynucleotide which comprises a 3'-end sequence, where the combination of the sequence ties at least 15 incleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those detined in the specification. The primer sets can be used in inclisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cours. The primers are also useful for the detection and/or diagnoss of the abnormality of the proteins encoded by the full-length cours, The primers allow obtaining of the full-length course and any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13629 to AAH13629 to AAH13629 represent human amino acid sequences; and AAH13629 to AAH13622 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tull-length cDMAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; primer; detection; diagnosis; antisense therapy; gene therapy.

sequence and an oligonucleolide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/4'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the discussion of the full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs.
                                    represent oligonucleotides, all of which are used of the present invention
                                                                         cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAH92446 to AAH95893 represent human amino acid sequences; and AAH13629 to AAH1363.
                                                                                                                                                                                                                                                                                                            complementary strand of a polynucleotide which comprises a
                                                                                                                                                                                                                                                                                                                             of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                               oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                    full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 8; SEQ 1D 11188; 2547pp 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-JAN-2000;

* NOTE: This is a 'working draft' sequence. It currently consists of 28 configs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the configs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (02-JUL-1998) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Pluza, H@uston, TX 77030, USA
On Jun 25, 1998 this sequence version replaced qi:3242666.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submitsion

This sequence was finished as follows unless otherwise noted:

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between nelghboring data submissions.

Center project name: H_DJ0907C10 Summary Statistics

all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

and The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGAT Chromosome? Mapping Project (Fric D. Greet, Directol), John D. Merberson in the hepartment of Genetics (Washington University), and the Washington University Genome Sequence. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIRKGTMACHR7, seed mailto:eqreen@nhqri.nih.gov , or see http://qenome.wustl.edu/qsc MAPPING INFORMATION:

This clone was derived from human PAC library RPC1-5, prepared by refets de dons and coworkers at the Koswell Park Cancer Institute (http://bocpac.med.bullalo.edu) using the method described by toming or al., Nature Genetics 6:84-9 (1994). The library is Irc SOURCE INFORMATION:

The library is from

Actual start of this clone is at base position 1 of RP5-907C10, actual end is at 154959 of RP5-907C10. (http://www.qenomesystems.com) or Research Genetics, Inc. (http://www.resqen.com); or from Pieter de Jong. VECTOR: pCYPAC2 The clone may be obtained either from Genome Systems, NETCHBORING SEQUENCE INFORMATION: one male denor.

The sequence from 4689 to 5920 is from PCk product from PAC RPs-907C10 DNA.
